

****1. HERITAGE — Company Milestones****

Expanded public milestone list based strictly on the official company profile. Descriptions incorporate the dual-engine structure, Trident philosophy, technology matrix, and talent platform as presented in the 2026 profile.

| 2025 | Incorporation of Andromeda Logic Corp Private Limited | Andromeda Logic Corp is incorporated in Bengaluru, India (CIN: U62011KA2025PTC211686). The company is founded on a dual-engine model: a space-tech core (Andromeda Logic) focused on autonomous systems, compute and research infrastructure, and a talent engine (Andromeda Ignite) delivering university training, Centres of Excellence and placement pathways. | Public |

| 2025 | Establishment of Bengaluru Headquarters | Corporate headquarters and core engineering operations are established in Bengaluru. The site becomes the centre for GNC and autonomy research, hardware-in-the-loop simulation, research infrastructure development, and corporate leadership. | Public |

| 2025 | Definition of the Dual-Engine Operating Model | Formal adoption of the dual-engine architecture. Andromeda Logic develops space-grade autonomy, edge compute, digital twins and mission systems. Andromeda Ignite builds campus talent pipelines, CoEs and industry immersion programs using the same technical standards. | Public |

| 2025–2026 | Adoption of the Trident Philosophy | The company identity is codified around three principles — Creation (building systems that did not previously exist), Preservation (keeping missions, knowledge and careers reliable), and Dissolution (intentionally retiring, recycling and regenerating hardware, data and human capital). | Public |

| 2025–2026 | Articulation of Vision and Mission | Vision is stated as “Intelligence that can fly itself — from Earth orbit to deep space.” Mission is defined as delivering research infrastructure and talent that India — and the world — can fly on. | Public |

| 2025–2026 | Core Technological Matrix Defined | Three primary technology orbits are formalised: (1) Deep-Space Navigation & Neural Guidance, (2) Fault-Tolerant Edge & Quantum Computing, and (3) Extreme Environment Hardware & Adaptive Robotics. Supporting layers include digital twins, HPC simulation, secure collaboration and standards interfaces. | Public |

| 2025–2026 | Launch of Andromeda Ignite Platform | Andromeda Ignite is established as the education and talent vertical, offering Foundation → Specialisation → Industry Immersion → Placement pathways, university Centres of Excellence, adaptive AI assessment, and partnerships with global technology majors. | Public |

| 2026 | First Public Company Profile Release | The confidential 2026 company profile is prepared, presenting the full technology lattice, industry presence across eight verticals, Ignite outcome metrics, engagement models, and leadership (Directors: Vijayendra Akshay, Abhishek Tripathi, Salma Siddiq). | Public |

No pre-2025 founding narrative, flight heritage, orbital deployments, external grants or awards are documented in the available materials; therefore none are included. Additional milestones may be added only after formal public-approval.

****2. PRESENCE — Engineering & Mission Operations****

Verified against the official profile. Only Bengaluru is confirmed as a physical location. All other activity is described as distributed collaboration.

| City / Country | Facility Type | Primary Function | Short Public Description | Exact Address? |

| --- | --- | --- | --- |

| Bengaluru, India | Headquarters & Core Engineering | Primary research, GNC/autonomy algorithm development, hardware-in-the-loop simulation labs, research infrastructure, corporate operations, and Andromeda Ignite program leadership | Official headquarters of Andromeda Logic Corp. Home to the space-tech core, simulation and digital-twin environments, and the central coordination of university Centres of Excellence and talent programs. | Yes |

| Remote / Distributed | Research, Academic & Industry Partnerships | Collaborative R&D, university CoEs, industry immersion, secure multi-party research environments | Research and academic programs are delivered through a distributed model with universities, national laboratories and industry partners across India and internationally, using both physical CoE labs and secure remote collaboration platforms. | No |

Public address:

118, 3rd Cross Road, Okalipuram, Bengaluru 560021, India

Any additional facilities should be listed only after formal approval for public disclosure. Exact street addresses beyond the Bengaluru headquarters are not recommended for general website display unless specifically cleared.

****3. FAQ — Home Page & Other Website Pages****

Answers expanded with additional detail drawn directly from the company profile (technology matrix, computational stack, Ignite structure, metrics, engagement pathways, Trident principles). Language remains public-facing and avoids unverified claims.

A. Home Page FAQs

****Q: What is Andromeda Logic Corp?****

A: Andromeda Logic Corp is a Bengaluru-headquartered private limited company (incorporated 2025) building next-generation space and research technology. We operate a dual-engine model: Andromeda Logic develops autonomous space systems, fault-tolerant compute, extreme-environment hardware and research infrastructure; Andromeda Ignite builds university Centres of Excellence, training-to-placement pathways and industry immersion programs. Our identity is guided by the Trident principles of Creation, Preservation and Dissolution.

****Q: What does Andromeda Logic Corp build?****

A: We build autonomy and guidance systems that can operate with reduced dependence on continuous Earth contact, radiation-aware and fault-tolerant edge compute, adaptive robotics for harsh environments, digital twins of missions/campuses/factories, high-performance simulation clusters, secure collaboration platforms, and the full Andromeda Ignite talent stack (curriculum, labs, adaptive assessment and placement pipelines). The same technical lattice supports both space missions and campus talent development.

****Q: What problems does Andromeda Logic Corp solve?****

A: We address two interconnected challenges. First, the need for intelligence and systems that can sense, decide, act and learn in space environments ranging from Earth orbit to deeper space. Second, the need for research-grade talent pipelines and campus infrastructure that meet the standards of modern industry and national programs. Our dual-engine approach closes the loop between advanced technology development and the human capital required to sustain it.

****Q: Who are your customers or target users?****

A: Our work serves space exploration, space situational awareness and payload programs; defence and dual-use autonomy; energy and climate modelling; health and research laboratories; smart-city sensing and simulation; industrial robotics and digital threads; mobility guidance and fleets; and universities seeking Centres of Excellence, specialised training cohorts and high-quality placement outcomes.

****Q: What technologies does Andromeda Logic Corp specialize in?****

A: Core specialisations include Deep-Space Navigation & Neural Guidance (self-correcting trajectory AI, multi-body dynamics, real-time hazard avoidance), Fault-Tolerant Edge & Quantum Computing (radiation-hardened NPUs, redundant neural clusters, quantum-inspired optimisers), and Extreme Environment Hardware & Adaptive Robotics. Supporting layers cover payload-edge inference, mission AI, digital twins, HPC simulation, secure ground meshes, data observatories and standards interfaces.

****Q: What makes Andromeda Logic Corp different?****

A: We combine space-grade research and engineering standards with a full-stack talent engine under one roof. The same principles, simulation environments and technical rigour that shape our autonomy and compute systems also underpin university CoEs, adaptive AI assessment and industry immersion. This produces both advanced systems and the people who can build, operate and evolve them — guided by the Trident ethic of Creation, Preservation and Dissolution.

****Q: Where does Andromeda Logic Corp operate?****

A: Headquarters and core engineering are located in Bengaluru, India. Research collaborations, university Centres of Excellence and industry immersion programs are delivered through a distributed model with academic and institutional partners across India and internationally.

****Q: How can companies or organizations work with Andromeda Logic Corp?****

A: Four primary engagement pathways are available: (1) University Centres of Excellence (curriculum, labs, faculty development, certification), (2) Andromeda Ignite training-to-placement cohorts for entire campuses, (3) Corporate R&D partnerships in autonomy, compute and research infrastructure, and (4) Mission or dual-use programs. Initial discussions can be initiated through the contact channels on this website.

****Q: Are you open to research or academic collaborations?****

A: Yes. We actively establish and operate university Centres of Excellence in partnership with global technology majors, run research-aligned training programs, support faculty development, and collaborate on projects that align with our technology domains. Interested institutions and researchers are invited to contact us.

B. Technology Page FAQs

****Q: What core technologies does Andromeda Logic Corp develop?****

A: Our core technological matrix centres on three orbits: Deep-Space Navigation & Neural Guidance, Fault-Tolerant Edge & Quantum Computing, and Extreme Environment Hardware & Adaptive Robotics. These are supported by a broader lattice that includes autonomy software, mission ML, orbital mechanics, HPC, quantum-ready methods, cybersecurity, digital twins, satcom interfaces, edge inference and large-scale simulation.

****Q: What is your approach to GNC and autonomous systems?****

A: We design systems around a continuous Sense → Decide → Act → Learn loop. This supports guidance, on-orbit autonomy, swarm coordination and ground-loop integration. The goal is intelligence that can operate with reduced reliance on continuous Earth contact, from near-Earth orbit to deeper space, while remaining grounded in rigorous dynamics, fault tolerance and human-on-the-loop oversight where required.

****Q: Do you develop hardware, software, or both?****

A: Both. Hardware work includes radiation-tolerant and extreme-environment components, actuators and adaptive mobility systems. Software and systems work spans edge inference, mission AI, autonomy algorithms, digital twins, simulation environments and secure collaboration platforms. The stack is designed end-to-end — from payload edge to ground mesh.

****Q: What simulation and testing environments do you use?****

A: We maintain hardware-in-the-loop benches, digital twins of missions, campuses and factories, high-performance computing clusters for research-scale simulation, secure (including air-gapped) collaboration environments, data observatories spanning sensor to archive, and standards desks that enable other laboratories to interface with our work.

****Q: How do you validate systems for space environments?****

A: Validation combines radiation-aware and thermal-vacuum design principles, fault-tolerant architectures, hardware-in-the-loop testing, digital-twin simulation, and multi-layer anomaly response. The same research standard applied to space systems is used across our broader technology and talent platforms.

****Q: Do you develop AI/ML or edge inference systems?****

A: Yes. Capabilities include on-sensor and payload-edge inference (where bandwidth is scarce), mission AI for planning and anomaly response, adaptive assessment models used in Andromeda Ignite, and quantum-inspired optimisers. Models are designed to live with the craft or the campus system they support.

C. Products / Solutions Page FAQs

****Q: What products or platforms are currently available?****

A: Publicly positioned offerings include autonomy and guidance systems, fault-tolerant edge and mission compute stacks, digital-twin and HPC simulation infrastructure, secure research collaboration platforms, and the full Andromeda Ignite suite (Foundation-to-Placement pathways, university Centres of Excellence, adaptive assessment portal, and industry immersion programs). Specific configurations are developed in partnership according to customer or institutional requirements.

****Q: Are your solutions customizable?****

A: Yes. Virtually all engagements are tailored. University CoEs are designed around institutional needs and partner technology majors; Ignite cohorts are mapped to campus profiles and hiring demand; corporate and mission work is scoped to specific autonomy, compute or research-infrastructure requirements.

****Q: Who can request a product or mission consultation?****

A: Universities and academic institutions, space and dual-use organisations, defence-related entities, industrial and infrastructure operators, research laboratories, and other organisations whose needs align with our technology domains and Trident principles.

****Q: How does a typical engagement work?****

A: Engagements generally follow: initial discussion and requirements alignment → technical or program design → delivery (systems, CoE build-out, training cohort, or research infrastructure) → integration, validation and iteration support. For Ignite programs the pathway is structured as Foundation → Specialisation → Industry Immersion → Placement.

****Q: Can your systems integrate with existing aerospace/industrial infrastructure?****

A: Integration is a design priority. We develop interfaces, standards alignment and secure collaboration layers intended to work with partner laboratories, operational environments, university systems and existing industrial digital threads.

****Q: What is the typical timeline for a project?****

A: Timelines vary significantly with scope. University CoE and Ignite cohort programs typically operate on multi-month academic or placement cycles. Corporate R&D and mission-system developments are longer and are defined case-by-case during the design phase. Detailed schedules are established once requirements are clear.

D. Research Page FAQs

****Q: What areas does Andromeda Logic Corp research?****

A: Primary research domains include autonomous space systems, deep-space navigation and neural guidance, fault-tolerant and quantum-ready computing, extreme-environment robotics and adaptive systems, digital twins, high-performance simulation, mission AI, secure multi-party research environments, and the infrastructure required to make these capabilities usable by other laboratories and campuses.

****Q: Does Andromeda Logic Corp collaborate with universities?****

A: Yes. Collaboration models include full Centres of Excellence (curriculum design, laboratory setup, faculty development and certification, often in partnership with global technology majors), Ignite training-to-placement programs for entire campuses, joint research projects, and industry immersion experiences with organisations such as national laboratories and major industrial partners.

****Q: Does the company publish research or technical papers?****

A: Research dissemination is part of our longer-term activity. Specific publications, technical notes and links will be listed on this website as they are approved for public release.

****Q: Can researchers or students collaborate with the company?****

A: Eligible faculty, researchers and students can engage through Centres of Excellence, research partnerships, Ignite programs and industry immersion. Interested individuals and institutions should contact us via the channels on this website to discuss eligibility and opportunities.

E. Company / Contact Page FAQs

****Q: How can I contact Andromeda Logic Corp?****

A: Please use the contact form or designated email address on this website. Our headquarters is located at 118, 3rd Cross Road, Okalipuram, Bengaluru 560021, India. Leadership includes Directors Vijayendra Akshay, Abhishek Tripathi and Salma Siddiqua.

****Q: How can I request a mission consultation?****

A: Indicate interest in mission, dual-use or corporate R&D engagement through the contact channels on this site. Our team will respond to arrange an initial discussion and requirements scoping.

****Q: Where are Andromeda Logic Corp's offices and facilities located?****

A: The official headquarters and core engineering operations are in Bengaluru, India. Research, academic and industry programs are delivered through a distributed partnership model with universities and institutions.

****Q: Are you hiring?****

A: Team growth follows program and engagement needs. Open roles, when available, together with application information, will be published in the Careers section of this website.

****Q: How can organizations propose a partnership?****

A: Organisations may propose University CoE partnerships, Ignite campus cohorts, corporate R&D collaborations, or mission/dual-use programs. Proposals aligned with our technology domains and Trident principles (Creation · Preservation · Dissolution) can be submitted through the contact channels on this website. We review opportunities on a rolling basis.

All expanded content remains grounded in the official 2026 company profile. No flight heritage, pre-2025 history, unverified performance claims, or unlisted locations have been introduced. Further refinements can be made once additional approved material is provided.
